

Silence Therapeutics' position is strengthened after European Patent Office revokes competitor RNA interference patent in its entirety

London 10 December 2008 – The Technical Board of Appeal of the European Patent Office has issued a final decision revoking in its entirety a patent, which was thought to be important in the field of RNA interference.

The revoked patent is European patent EP 1 144 623, which is owned by Alnylam Europe AG and was originally issued in 2002.

After a hearing yesterday, the Technical Board of Appeal stated that the amendment of the originally granted claims during opposition proceedings was inadmissible. The amendment of the originally granted claims has been the basis for maintaining the Alnylam patent in the first instance. The Board of Appeal found that the disclosure of the patent does not allow a claim to a double-stranded RNA of 15 to 21 base pairs in length.

Dr. John Lucas, General Counsel & Vice President, Intellectual Property, at Silence Therapeutics, said:

"We are pleased with the Board of Appeal's final decision. We believe the European Patent Office will take the same line on any further patents and patent applications which might emerge from this disallowed patent. Any patent and patent application derived from it as a divisional will suffer from the same shortcomings in terms of disclosure."

Iain Ross, Chairman and Chief Executive of Silence Therapeutics, said:

"This decision confirms that no one company dominates the IP within the RNA interference space. After recent announcements on Silence's research achievements and progress towards the clinic, this ruling demonstrates that this company offers development partners access to 'best-in-class' technology in this exciting and expanding field."

About Silence Therapeutics plc (www.silence-therapeutics.com)

Silence Therapeutics plc (AIM: SLN) is a leading European RNAi-focused biotechnology company.

RNA interference (RNAi), is a Nobel Prize winning technology and one of the most exciting areas of drug discovery today. It represents a completely new approach to selectively 'silence' or inactivate disease relevant genes and as such it has the potential to create a new class of therapeutic products. RNAi could therefore offer a therapeutic approach to a broad range of diseases (cancer, infectious diseases, inherited diseases), many of which have been regarded as incurable and are not addressed by current therapeutics, therefore providing a large market opportunity.

Silence Therapeutics has developed a platform of novel short interfering RNA ('siRNA') molecules, AtuRNAi, which provide a number of advantages over conventional siRNA molecules, including increased stability against nuclease degradation. In addition, the Company has developed a proprietary systemic delivery system, AtuPLEX. This system enables the functional delivery of siRNA molecules to targeted diseased tissues and cells, while increasing their bioavailability and intracellular uptake.

Following the granting of its patents in Europe, the USA and Australia, Silence Therapeutics is one of only two companies worldwide with a proprietary position on composition of matter for siRNA therapeutics.

Silence's lead internal product, Atu027, is a proprietary AtuRNAi molecule in preclinical development for systemic cancer indications. Atu027 has successfully completed single and repeat dose toxicology and geno-toxicology studies, as well as a 28-day toxicology study using multiple dosing regimens. Silence plans a regulatory filing in 2008 to commence clinical trials for Atu027.

In March 2008 Silence Therapeutics announced a collaboration with AstraZeneca (LSE: AZN) focused on the development of a range of novel delivery approaches for siRNA molecules. Under the terms of the agreement both Silence Therapeutics and AstraZeneca will be allowed to commercialize the truly novel delivery systems that the two partners develop together.

Silence Therapeutics has granted a licence to AstraZeneca to develop novel AtuRNAi therapeutics against five specific targets. This collaboration was the first industry validation of the potential application of Silence Therapeutics' proprietary AtuRNAi molecules and solidified the Company's leadership position in field of RNAi therapeutics.

The Company's AtuRNAi technology also has been sublicensed to Pfizer via Quark's license to them of the compound RTP-801i-14 for the treatment of age-related macular degeneration (AMD) and a number of other indications. This compound entered a phase II clinical study in July 2008. Silence Therapeutics also has licensed to Quark rights to the AtuRNAi structure for Quark's proprietary compound, AKli-5, which is in a Phase I human clinical study for treatment of acute kidney injury.

Forward-Looking Statements

This press release includes forward-looking statements that are subject to risks, uncertainties and other factors. These risks and uncertainties could cause actual results to differ materially from those referred to in the forward-looking statements. All forward-looking statements are based on information currently available to Silence Therapeutics and Silence Therapeutics assumes no obligation to update any such forward-looking statements.

Silence Therapeutics is based in London, UK, and Berlin, Germany, and is listed on AIM.
